#### Model selection

Logistic regression coefficient 
$$\hat{\theta}_q$$
 given via MLE

$$\hat{\theta}_{\boldsymbol{q}} = \operatorname{argmax} \ell(\boldsymbol{ heta}_{\boldsymbol{q}}; (\mathbf{x}, \mathbf{y})) = \sum_{i=1}^{n} \ln p_{\boldsymbol{ heta}_{\boldsymbol{q}}}(y_i | \boldsymbol{q}(\boldsymbol{x}_i))$$

#### Best quantization $\hat{q}$ given by *e.g.* BIC

$$\hat{oldsymbol{q}} = \mathop{\mathrm{argmin}}_{oldsymbol{q}\in\mathcal{Q}} \mathsf{BIC}(\widehat{oldsymbol{ heta}}_{oldsymbol{q}})$$

**Obvious problem:** Q is huge!

- d = 10 categorical features
- $I_j = 4$  levels each
- lacksquare  $|\mathcal{Q}|pprox$  6  $\cdot$  10<sup>11</sup>

#### Supervised multivariate quantization: a relaxation

▲□▶ ▲□▶ ▲ ■▶ ▲ ■ ▶ ▲ ■ ♪ ♥ ■ ♪ ♥ ♥ 12/26

#### Smooth approximation of the quantization

$$oldsymbol{q}_{oldsymbol{lpha}_{j}}(\cdot) = ig(q_{oldsymbol{lpha}_{j,h}}(\cdot)ig)_{h=1}^{m_{j}} ext{ with } egin{cases} \sum_{h=1}^{m_{j}} q_{oldsymbol{lpha}_{j,h}}(\cdot) = 1, \ 0 \leq q_{oldsymbol{lpha}_{j,h}}(\cdot) \leq 1, \end{cases}$$

For continuous features, we set for  $\alpha_{j,h} = (\alpha_{j,h}^0, \alpha_{j,h}^1) \in \mathbb{R}^2$ 

$$q_{\boldsymbol{\alpha}_{j,h}}(\cdot) = \frac{\exp(\alpha_{j,h}^{0} + \alpha_{j,h}^{1} \cdot)}{\sum_{g=1}^{m_{j}} \exp(\alpha_{j,g}^{0} + \alpha_{j,g}^{1} \cdot)}$$

For categorical features, we set for  $\alpha_{j,h} = (\alpha_{j,h}(1), \dots, \alpha_{j,h}(l_j)) \in \mathbb{R}^{l_j}$ 

$$q_{\alpha_{j,h}}(\cdot) = \frac{\exp\left(\alpha_{j,h}(\cdot)\right)}{\sum_{g=1}^{m_j} \exp\left(\alpha_{j,g}(\cdot)\right)}$$

■ ● ■ のQで 13/26

#### Go back to "hard" thresholding: MAP estimation

#### Validity of the approach

$$\ell_{\boldsymbol{q}_{\alpha}}(\boldsymbol{ heta};(\mathbf{x},\mathbf{y})) = \sum_{i=1}^{n} \ln p_{\boldsymbol{ heta}}(y_i | \boldsymbol{q}_{\alpha}(\boldsymbol{x}_i))$$
  
 $q_{j,h}^{MAP}(x_j) = 1 ext{ if } h = rgmax_{1 \le h' \le m_j} q_{\hat{\alpha}_{j,h'}}, 0 ext{ otherwise.}$ 

- 1. MAP procedure yields contiguous intervals [Samé et al., 2011].
- 2. The  $\alpha$  parameters can be written explicitly w.r.t. cutpoints [Chamroukhi et al., 2009].
- 3. Under classical regularity conditions and if the model is well-specified, maximizing  $\ell_{\boldsymbol{q}_{\alpha}}(\boldsymbol{\theta}; (\mathbf{x}, \mathbf{y}))$  w.r.t.  $(\boldsymbol{\alpha}, \boldsymbol{\theta})$  is equivalent to maximizing  $\ell_{\boldsymbol{q}}(\boldsymbol{\theta}; (\mathbf{x}, \mathbf{y}))$  over  $(\boldsymbol{q}, \boldsymbol{\theta})$  which was untractable.
